CSSE3100 Crib Sheet

Exam Format

The confirmed format of the exam is:

`Q1` weakest precondition reasoning.
`Q2` method specification and loop invariants.
`Q3` recursion and termination metrics.
`Q4` classes and data structures.
`Q5` lemmas and functional programming

This section will be removed before the exam

Question 1

`book` Default is two-sided.
`report` No `\part` divisions.
`article` No `\part` or `\chapter` divisions.
`letter` Letter (?).
`slides` Large sans-serif font.

Question 5

Lemmas

lemma $name(x_1 : T, x_2 : T, \ldots, x_n : T)$
requires P
ensures R
{ }

Lemmas can be called in a method to **prove** the lemmas property from that point onwards.

Weakest Precondition

wp(M(E), Q) = `P[x\E] && (R[x\E] ==> Q)`

Calc

To prove a lemma by hand, you can add a **calc** section into the lemmas body, where γ is the default transitive operator between lines.

calc γ {
$5 * (x + 3)$;
$== 5 * x + 5 * 3$;
$== 5x + 15$;
}

You can use use any transitive operator between lines (e.g. ==>). If no default operator is specific, the default is ==.
The **calc** statements can also be added inline within a method instead of creating and calling a lemma.

Induction

Lemmas can also be used to prove using induction by recursively calling the lemma in the body. E.g.

lemma SumLemma(a: $array_¡int_¿$, i: *int*, j: *int*)
requires P
ensures R
{
if i == j {} // base case: Dafny can prove
else {
SumLemma(a, i+1, j); // inductive case
}
}

Functional Programming

Key features:

- Program structures as mathematical functions
- Data is immutable (i.e. no heap, no side effects)

Match

Match is dafny's version of a switch statement, but it must cover all cases.

match x
case c_1
case c_2
...
case c_n

Descriminators

Discriminators can be used to check if a variable is a given type. E.g. xs.Nil**?** checks if xs is type Nil.

Destructors

Destructors are used to access data in a composite datatype. E.g. for a variable xs of the datatype
datatype `List<T>` = Nil — Cons(head: T, tail: `List<T>`), head can be accessed using xs.head. Similarly tail can be accessed using xs.tail.

Instrinsic vs Extrinsic Property

- An intrinsic property is a property defined within a specification.
- An extrinsic property is a property defined externally using a lemma.
- Methods in Dafny are opaque, so all properties in the specification are intrinsic.
- Functions are transparent, so properties can be intrinsic or extrinsic.
- Intrinsic properties are available every time we apply a function, whereas extrinsic properties are only available if we call the lemma.
- Having all properties exposed instrinsicly can lead to long verification times, so only define properties intrinsicly if they will be required for all applications of the function.

Common `documentclass` options

`\subsection{`*title*`}`
`\subsubsection{`*title*`}`
`\paragraph{`*title*`}`
`\subparagraph{`*title*`}`

Use `\setcounter{secnumdepth}{`x`}` suppresses heading numbers of depth $> x$, where `chapter` has depth 0. Use a `*`, as in `\section*{`*title*`}`, to not number a particular item—these items will also not appear in the table of contents.

`\begin{description}` Description list.
`\item` *text* Add an item.
`\item[`x`]` *text* Use x instead of normal bullet or number. Required for descriptions.

References

`\label{`*marker*`}` Set a marker for cross-reference, often of the form `\label{sec:item}`.
`\ref{`*marker*`}` Give section/body number of marker.
`\pageref{`*marker*`}` Give page number of marker.

`\caption{`*text*`}` Caption for the body.

The *place* is a list valid placements for the body. `t`=top, `h`=here, `b`=bottom, `p`=separate page, `!`=place even if ugly. Captions and label markers should be within the environment.

The BibTeX database goes in a file called *file*.bib, which is processed with bibtex file.

```
@String{N = {Na\-ture}}
@Article{WC:1953,

  title   = {A structure for Deoxyribose Nucleic Acid},
  journal = N,
  volume  = {171},
